GRANTACONOR'S POSSIBLE

This Catalogue has been drawn up by Mr. E. T. Newton, Assistant Naturalist, under my superintendence.

The Invertebrata have been named by Mr. Etheridge, F.R.S., Palaeontologist to the Geological Survey of Great Britain.

T. H. HUXLEY.

## P R E F A C E.

THE Catalogue of Fossils exhibited in the Museum of Practical Geology has been out of print for several years. It is intended that some additional cases shall by-and-by be used for the reception of fossils, and as these arrangements will for a time delay the preparation of a complete catalogue of the fossils occurring in all the formations, it has been decided to issue it in successive parts, each part containing a list of the fossils of each formation belonging to separate groups of strata. One advantage of this plan is that geologists specially interested in any particular group of formations shall be able to procure any one part, such as lists of the fossils of the Silurian, Cretaceous, or Tertiary strata.

The following catalogue contains lists of fossils beginning with the Neocomian or Lower Greensand series of strata, for long known as Lower Cretaceous beds, and these are succeeded in ascending order by lists of the fossils of the Gault, Upper Greensand, and the subdivisions of the Chalk.

Occasionally some geologists have been in doubt as to the precise geological nomenclature that ought to be applied to some of the strata mentioned in this catalogue. One of these, the Blackdown beds, has been referred by different persons to the Upper Greensand, the Gault, and the Lower Greensand, in whole or in part. At first sight it appears from ordinary physical considerations that they form outlying patches of the Upper Greensand, the whole of this large outlier of Greensands being fragments of a much larger extension to the west of the Upper Cretaceous series, for they are in places west of the river Axe and Ilminster, capped by patches of Chalk, and it has often been assumed that, as they now stand, they have been simply separated by denudation from the main body of the Upper Cretaceous series which forms the country from Dorsetshire to Beachy Head, the North Foreland, and Flamborough Head.

When, however, we turn to the fossils of the Blackdown Sands it appears that in about 100 species 40 are found elsewhere in England in undoubted Lower Greensand, 29 in the Gault, and about 15 in the Upper Greensand. The predominance of Lower

Greensand forms suggests that in the main the Blackdown Sands belong to that formation. The strata from bottom to top are mostly sandy, and indeed have lithologically an Upper Greensand character, but it may be, though it is impossible to draw subdivisions on the map, that all three divisions are represented.

It is well known that of 400 Lower Greensand species of mollusca only about 70 pass into the Gault and Upper Greensand. With regard to lithological variations it is also well known that in the eastern half of the escarpment of the North Downs and elsewhere it is impossible satisfactorily to separate the Gault from the Upper Greensand, and the Upper Greensand from the Lower Chalk. They graduate lithologically into each other, the peculiar characters of Greensand and Gault having been locally determined during their deposition by depth of water and distance from land.

In connexion with this subject I may mention that the *so-called* Cambridge Upper Greensand lithologically resembles the Chloritic Marl of the south-west of England, which may be said to form the base of the Chalk.

The Potton beds, called Neocomian, are also somewhat abnormal in a palæontological point of view. The majority of the species of mollusca (22) are known Neocomian forms. Most of the genera of fishes however (*Asteracanthus*, *Lepidotus*, *Strophodus*, and *Hybodius*) and also the two genera of reptiles (*Megalosaurus* and *Plesiosaurus*) which are only represented by rolled and waterworn fragments, have probably been derived from the waste of the Kimmeridge clay on which the Potton beds lie, or even from older Jurassic strata. The Vertebrata therefore cannot be safely classed as of Neocomian age.

ANDREW C. RAMSAY,  
Director-General.
